

Free Form Plastic Products is pleased to be offering the newly re-designed 300 US gallon Waste/Recycle Container. This container size has been tried and tested and now through a close working relationship with our customer network we have developed a container with features and durability to change the market.

References available upon request.

Our new container includes such features as:

- High Density Super Linear Construction to withstand the harsh operating environment and still be recyclable in the case of unforeseen events
- Molded with a double top lip on the can to increase strength and eliminate stress points
- Molded in handle added to the hinge side of the container on the bottom diameter. This handle position allows access from the back or bottom of the container for operator ease when handling and also allows the cans to nest properly without extra blocking
- Molded in lugs along side of can to help minimize required clamping pressure on containers
- Dual lid system to allow easy operation by users on both small and large scale
